

inDepth virtual environment security

*East - West Security, FW rules Management,
Microsegmentation, New Topologies, Efficient Scalling*

what is for?

InDepth Virtual Environment Security solution provides you:

- ✓ • **Micro-segmentation:** enables granular firewalling and security policy enforcement for every workload in the data center, independent of the network topology and complexity.
- ✓ • **DMZ Anywhere:** enables security and advanced services to be dynamically assigned to workloads independent of the underlying physical network. This dramatically improves time to response, overall security posture, and third-party integration.
- ✓ • **Compliance:** enables micro-segmentation and granular security of workloads in virtualized networks, isolating sensitive systems and reducing both risk and scope of compliance. Use NSX to help ensure and demonstrate compliant operations with many regulations such as PCI DSS, HIPAA, FedRAMP, SOC, CJIS, DISA STIG, and more
- **Securing the East-West Network**
